## Beschreibung

Die vorliegende Erfindung betrifft ein neues herbizides Mittel, welches eine herbizide Wirkstoffkombination enthält, die sich zur selektiven Unkrautbekämpfung in Nutzpflanzenkulturen, wie beispielsweise in Kulturen von Reis, Baumwolle, Zuckerrohr, Mais, Soja, Getreide, Raps, Zuckerrüben und Sonnenblumen sowie zur nicht-selektiven Unkrautkontrolle eignet. Die Erfindung betrifft ferner ein Verfahren zur Bekämpfung von Unkräutern in Nutzpflanzenkulturen, so wie die Verwendung dieses neuen Mittels zu diesem Zweck.

Die Verbindungen, wie sie in den folgenden Gruppen I und II aufgezählt sind, besitzen herbizide Wirkung, wie dies beispielsweise in Pesticide Manual, eleventh ed., British Crop Protection Council, 1997 beschrieben ist.

Es wird daher gemäß der vorliegenden Erfindung ein neues herbizides Mittel zur selektiven Unkrautbekämpfung vorgeschlagen, das neben üblichen inerten Formulierungshilfsstoffen als Wirkstoff eine Mischung aus

a) einer Verbindung der Gruppe I ausgewählt aus:

Pretilachlor, Cinosulfuron, Triasulfuron, Fenclozim, Clodinafop-propargyl, Metolachlor, S-Metolachlor, Fluometuron, Prometryn, Norfluorazon, Propaquizafop, Trinexapac, Atrazine, Ametryn, Dicamba, Terbutryn, Prosulfuron, Norflurazon, Terbutylazine, Simazine, Prosulfuron, Primisulfuron, Oxasulfuron, Fluthiacet-methyl, Clodinafop, Cloquintocet-mexyl, Prometryn, Dimethachlor, und

b) eine oder mehrere Verbindungen ausgewählt aus der Gruppe II:

Bensulfuron, Imazosulfuron, Pyrazosulfuron, Metsulfuron, Azimsulfuron, Cyclosulfamuron, Esprocarb, Mefenacet, Molinate, Propanil, Pyrazolate, Cyhalofop-butyl, Fenoxaprop-ethyl, Fenoxaprop-P-ethyl, ## Die Verbindung 1

ist in der Zeitschrift für Pflanzenkrankheiten und Pflanzenschutz, Sonderheft X, auf den Seiten 355-360 (1984) beschrieben.

## Die Verbindung 2

ist in US-A-5,332,717 beschrieben.

## Die Verbindung 3

ist aus WO 97/41112 bekannt. Oxaciclomefone und NB 061 (BAY YRC 2388) ist in Brighton Crop Protection Conf. 1997 beschrieben.

# DE 198 34 627 A 1

## Die Verbindung 4

ist in US-A-5,525,580 beschrieben.

## Die Verbindung MON 4660

(MON 4660) ist aus EP-A-0 436 483 bekannt. BAS 145138 ist unter dem Namen Dicyclonon (Safener für Metazachlor) bekannt. JV 485 (MON 48500) ist in AGROW 289, Seite 20 beschrieben. DMSA bedeutet Daminozide und ist in Pesticide Manuai, eleventh ed., British Crop Protection Council, 1997 beschrieben. Bei der Verbindung 5 handelt es sich um den in US-A-5,183,492 beschriebenen <S> 2-Chlor-S-(3,6-dihydro-2,6-dioxo-3-methyl-4-trifluormethyl-1(2H)pyrimidinyl)-benzoesäure-1-methylallylester.

Die beanspruchten Wirkstoffkombinationen umfassen auch als Herbizid bekannte Salze und Ester dieser Wirkstoffe.

Es ist in hohem Maße überraschend, daß die Kombination des Wirkstoffs der Gruppe I mit einem Wirkstoff der Gruppe II die prinzipiell zu erwartende additive Wirkung auf die zu bekämpfenden Unkräuter übersteigt und so die Wirkungsgrenzen beider Wirkstoffe insbesondere in zweierlei Hinsicht erweitert: Zum einen werden die Aufwandmengen der Einzelverbindungen bei gleichbleibend guter Wirkung gesenkt. Zum anderen erzielt das erfindungsgemäße Mittel auch dort noch einen hohen Grad der Unkrautbekämpfung, wo die Einzelsubstanzen im Bereich geringer Aufwandmengen agronomisch nicht mehr brauchbar geworden sind. Dies hat eine wesentliche Verbreiterung des Unkrautspektrums und eine zusätzliche Erhöhung der Selektivität für die Nutzpflanzenkulturen zur Folge, wie es im Falle einer unbeabsichtigten Wirkstoffüberdosierung notwendig und erwünscht ist. Des weiteren erlaubt das erfindungsgemäße Mittel unter Beibehaltung der herausragenden Kontrolle der Unkräuter in Nutzpflanzen eine größere Flexibilität bei Nachfolgekulturen.

Das erfindungsgemäße Mittel kann gegen eine große Anzahl agronomisch wichtiger Unkräuter, wie Stellaria, Nasturtium, Agrostis, Digitalia, Avena, Setaria, Sinapis, Lolium, Solanum, Phaseolus, Echinochloa, Scirpus, Monochoria, Sagittaria, Bromus, Alopecurus, Sorghum halepense, Rottboellia, Cyperus, Abutilon, Sida, Xanthium, Amaranthus, Chenopodium, Ipomoea, Chrysanthemum, Galium, Viola und Veronica verwendet werden. Das erfindungsgemäße Mittel ist für alle in der Landwirtschaft üblichen Applikationsmethoden wie z. B. preemergente Applikation, postemergente Applikation und Saatbeizung geeignet. Das erfindungsgemäße Mittel eignet sich vorzugsweise zur Unkrautbekämpfung in Nutzpflanzenkulturen wie Getreide, Raps, Zuckerrübe, Zuckerrohr, Plantagen, Reis, Mais und Soja sowie zur nicht-selektiven Unkrautkontrolle.

Unter Kulturen sind auch solche zu verstehen, die durch konventionelle züchterische oder gentechnologische Methoden gegen Herbizide bzw. Herbizidklassen tolerant gemacht worden sind.

Als ganz besonders wirksame Mittel haben sich die folgenden Kombinationen von Wirkstoffen erwiesen:
